

Protected Members

sealed

A class can prevent other classes from inheriting it, or any of its members, by using the **sealed** modifier.

For example:

```
sealed class Animal {  
    //some code  
}  
class Dog : Animal { } //Error
```

cs

Try it Yourself

In this case, we cannot derive the Dog class from the Animal class because Animal is **sealed**.

The **sealed** keyword provides a level of protection to your class so that other classes cannot inherit from it.

What's My Account Balance?

Fix the program to output the correct balance amount.
